	$\frac{1}{\lambda_2} = R\left[\frac{1}{1^2} - \frac{1}{2^2}\right]$ ……………………………………………… (ii)	½	
	$\frac{(2)}{(1)} = \frac{\lambda_1}{\lambda_2} = \frac{27}{5}$	½	2
	Alternatively - If electrons jump from second excited state to first excited state and second excited to ground state respectively		
	$\frac{1}{\lambda} = R\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$	½	
	$\frac{1}{\lambda_1} = R\left[\frac{1}{2^2} - \frac{1}{3^2}\right]$	½	
	$\frac{1}{\lambda_2} = R\left[\frac{1}{1^2} - \frac{1}{3^2}\right]$	½	
	$\frac{\lambda_1}{\lambda_2} = \frac{32}{5}$	½	2

9.	i) Diagram(or statement) for justification 1 ii) Net force (expression) 1  Alternatively The forces due to the charges placed diagonally opposite at the vertices of hexagon, on the charge -q cancel in pairs. Hence net force is due to one charge only. Net Force $\lvert\overline{F}\rvert = \frac{1}{4\pi\varepsilon_0}\ \frac{q^2}{l^2}$ Ne OR I) Diagram ½ ii) Derivation of period of oscillation 1½  Derivation F_r=-qEsinφ (Restoring force) ma=-qEsinφ when φ is small ma = -qEφ $m\ \frac{d^2x}{dt^2} = -qE\ \frac{x}{l}$ $\frac{d^2x}{dt^2} = -q\ \frac{E}{m}\ \frac{x}{l}$ comparing with equation of linear SHM. $\frac{d^2x}{dt^2} = -\omega^2 x.$ $\omega = \sqrt{\frac{qE}{ml}}$	1 1 ½ ½ ½	2 2

	$T = \frac{2\pi}{\omega} = 2\pi\sqrt{\frac{ml}{qE}}$ Alternatively - The student can use angular SHM expression also. Full marks to be awarded for correct answer even without intermediate steps..	½	
10	i) Graph showing decay of radioactive nuclei 1 ii) Determination of half life and average life. 1 i)  ii) From figure when $N = \frac{N_0}{2}$ $t = T½$ (half life) Average life $\tau = \frac{T½}{0.693}$	1 ½ ½	2
11.	Formula ½ Calculation of Induced Voltage 1½ Induced voltage $\lvert V \rvert = L\frac{dI}{dt}$ $\therefore \lvert V \rvert = \mu_0 n^2 la \frac{dI}{dt}$ $= 4\pi\times10^{-7}\times\left(\frac{10}{10^{-2}}\right)^2 \times 0.5 \times 1 \times 10^{-4} \times \frac{(2-1)}{0.1}$ $= 6.28 \times10^{-4}V$ or $0.628mV$ OR Calculation of (i) change of magnetic flux 1 (ii) induced emf 1 i) $\Delta\phi = \phi_2 - \phi_1 = 0 - NBA\cos\theta$ $= 140 \times 0.09 \times 5 \times 10^{-4} \cos0 = 63 \times 10^{-4}$ Wb	½ ½ ½ ½ 1	2 2

	Alternatively If student assumes that the coil was initially kept with its plane parallel to the field, i.e. φ =90°, Δϕ =(0 – 0) = 0 Wb award 1 mark ii) $e = \frac{-\Delta\phi}{\Delta t} = \frac{-63\times10^{-4}}{\Delta t}$ V Alternatively, if the student takes Δϕ = 0, then e = o, [Note: Award this 1 mark, If a student writes that induced emf cannot be calculated as value of time interval Δt it is not given.]	½+½	2
12.	i) Calculation of Equivalent capacitance 1 ii) Total Energy 1 i) Equivalent capacitance of two 3μF capacitor in parallel C_1=3+3 = 6μF Similarly equivalent capacitance of 1μF and 2μF in parallel $C_2 = 1 + 2 = 3\mu F$ Equivalent capacitance of C_1 and C_2 in series $C_{12} = \frac{6\times3}{6+3} = 2\mu F$ Net capacitance $C = 2 + 2 = 4\mu F$ ii) Energy stored $E = ½ CV^2$ $= ½ \times 4 \times 10^{-6} \times (100)^2$ $= 0.02$ J [Note: Award the 1 mark for correct calculation in part (ii) if the value of C_{eq} obtained in part (i) is correct]	½ ½ ½ ½	2
	Section B		
13	Calculation of: (i)Equivalent Resistance 1 (ii)Current from battery ½ (iii)Potential Difference 4V 1 ½ Equivalent resistance of the loop R_1 = 2 + 4 + 2 = 8Ω $\frac{1}{R_2} = \frac{1}{8} + \frac{1}{8}$ => R_2 = 4 Ω R_2 in series with 2 Ω and 2 Ω $R_{equivalent}$ = 2+ 4+ 2 = 8 Ω Current from battery = $\frac{V}{R_1} = \frac{16}{8} = 2A$	½ ½ ½	

	Let I_1= Current flowing through 4 Ω		
	Let I_2= Current flowing through 8 Ω		
	$I_1 + I_2 = 2A$, $8 X I_2 = 8 X I_1$	½	
	$I_1 = I_2 = 1A$	½	3
	Potential across 4 Ω = I_1 R= 1 X 4 = 4V	½	
	Alternatively if the student uses Kirchoff's rules to the solve the problem, full marks to be awarded for correct answer		
14	i) Reason for deflection 1 ii) Obtaining expression and showing relation 2 with conduction current.		
	While being charged, electron flow from battery into the capacitor until the capacitors is completely charged. As a result, galvanometer shows deflection.	1	
	Between the plates of the capacitor $\emptyset_E = \mid E \mid A = \frac{Q}{A \in_O} A = \frac{Q}{\in_O}$		
	Q changes with time and current $i = \frac{d\emptyset}{dt}$ So, $\frac{d\emptyset_E}{dt} = \frac{1}{\in_O} \frac{d\emptyset}{dt}$ => $i = \in_O \frac{dQ}{dt}$	1	
	This is the displacement current i_d.		
	Outside the plates, the current in the conductor due to the flow of charges is called conduction current. Alternatively, in steady state the current in circuit will be zero.	1	3

15	i) Explanation using phasor diagram 1 ii) Calculation of impedance 1½ iii) Calculation of potential difference ½		
			
	a) From phasor diagram it is clear that V_R is in phase with I and V_L is ahead of I in phase by $\pi/2$. Hence V_l is ahead of V_R by $\pi/2$	1	
	b) Let V be the effective potential difference across L-R circuit, therefore $V_{rms} = V = \sqrt{V_R^2+V_L^2} = \sqrt{(160)^2+(120)^2} = 200V$	½+½	
	$\therefore$ Impedance of the circuit, $Z = \frac{V}{I} = \frac{200}{1} = 200\Omega$	½	
	c) For d.c. (constant voltage source) V_L=0, therefore Potential difference in the circuit = 200V Alternatively, if the student takes it as a constant current source then the potential difference will be = $160V = V_R$	½	
	OR		
	i) Naming the circuit element Y ½ ii) Calculation of r.m.s value of current 1½ iii) Effect of replacing a.c source by d.c source 1		
	a) Y is a capacitor.	½	
	b) Phase angle, $\therefore \varphi = \pi/4$, $\cos\varphi = \frac{R}{Z}$	½	
	$\Rightarrow Z = \frac{R}{\cos\phi} = \frac{R}{\cos(\pi/4)} = \frac{100}{1/\sqrt{2}} = 100\sqrt{2} = 141.4\Omega$	½	3
	$I_{r.m.s} = \frac{V_{r.m.s}}{Z} = \frac{141V}{141.4\Omega} \cong 1A$	½	
	c) The current become zero.	1	

16	i) Explanation with diagram 2 ii) Definition of polarization and its expression for linear isotropic dielectric in terms of electric field. 1		
		½	
	For conductor Due to induction the free electrons collect on the left face of slab creating equal positive charge on the right face. Internal electric field is equal and opposite to external field; hence net electric field (inside the conductor) is zero.	½	
		½	
	For dielectiric Due to alignment of atomic dipoles (permanent or induced) along $\vec{E}$, the net electric field within the dielectric decreases.	½	
	ii) The net dipole moment developed per unit volume in the presence of external electric field is called polarization vector $\vec{P}$.	½	3
	Expression ∴ $\vec{P} = X_e \vec{E}$	½	

17

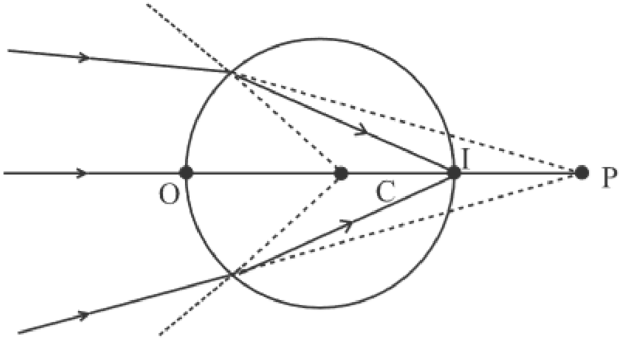
i) Calculation of new image position	2
ii) Ray diagram	1

a) u = 20cm, n_2=1.5, n_1 = 1, R = 5cm

Using $\frac{n_2}{v} - \frac{n_1}{u} = \frac{n_2 - n_1}{R}$ ½

$\frac{1.5}{v} - \frac{1}{20} = \frac{1.5-1}{5}$ 1 3

v = 10 cm ½



1

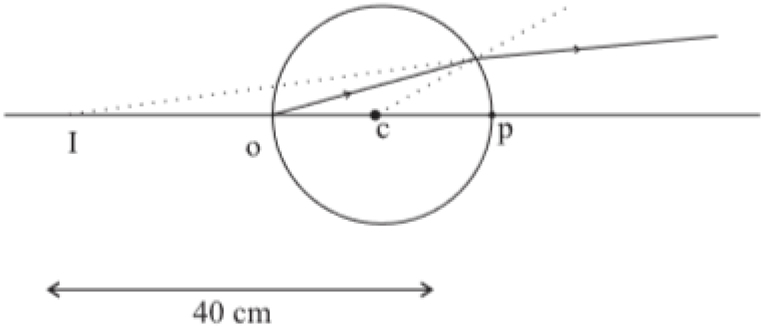
OR

Formula - 1
substitution and calculation - 1
Ray diagram - 1

$\frac{n_1}{-u} + \frac{n_2}{v} = \frac{n_2 - n_1}{R}$ 1

$\frac{1.5}{20} + \frac{1}{v} = \frac{1-1.5}{-10}$ ½

v = - 40cm ½



1

18	Obtaining balancing condition of wheatstone bridge 2 ½ One practical application ½		
	 	½	
	Applying kirchoff's loop rule to ADBA and CBDC		
	$-I_1R_1 + 0 + I_2R_2 = 0$	½	
	$I_2R_4 + 0 - I_1R_3 = 0$ Since, $I_g = 0$, $I_3 = I_1$, $I_4 = I_2$	½	
	$\frac{I_1}{I_2} = \frac{R_4}{R_3}$ and $\frac{I_1}{I_2} = \frac{R_2}{R_1}$	½	
	$\therefore \quad \frac{R_4}{R_3} = \frac{R_2}{R_1}$ (Balance Condition)	½	3
	A practical device using the principle of wheatstone bridge is meter bridge.	½	

19.	a) Graph showing variation of stopping potential with frequency - 1 b) Showing the determination of (i) Threshold frequency - 1 (ii) Planck's constant (from the graph) - 1 a. 	1	
	b. From Einstein's Equation $eV_o = h\nu - h\nu_o$ $V_o = \frac{h}{e}\nu - \frac{h}{e}\nu_o$	½	3
	comparing $y = mx + c$ (i) Threshold frequency ν_o is the intercept along ν axis. (Alternatively, intercept on V_o axis, $c = \frac{h}{e}\ \nu_o$ $\nu_o = \frac{ec}{h}$)	½	
	(ii) Planck's constant h = e x slope	1	

	OR		
	a. Explanation of emission of electron from a photosensitive surface - 1 b. Explanation and justification - 1 c. Finding the maximum KE - 1		
	a. When a photon of the energy $h\nu$ is absorbed by an electron in the photosensitive material, a part of the energy absorbed is used up in liberating it from the surface (the work function). The remaining energy appears as KE of the photoelectron.	1	3
	Alternatively: $K_{max} = h\nu - \phi_o$ if $h\nu \geq \phi_o$, k_{max} is positive and electron is emitted	½	
	b. Emission of electron will not take place. Energy $h\nu$, of a single photon, is less than the work function ϕ_o (Alternatively - $k_{max} = h\nu - \phi_o$ $h\nu < \phi_o$ so k_{max} is negative; Hence no emission will take place.)	½	
	c. $V_o = 1.5$ V $k_{max} = eV_o = 1.6 \times 10^{-19} \times 1.5 = 2.4 \times 10^{-19}$ J [If a student just writes, $k_{max} = 1.5$ eV award ½ mark]	1	
20.	a. Meaning of bandwidth and importance - 1 b. Differentiation between analog & Digital signal - 1 c. Functions of transducers and repeaters - 1		
	a. Bandwidth of a signal is the range over which the frequencies in that signal vary. (Also accept bandwidth is the frequency range over which an equipment/device operates)	½	

	The knowledge of bandwidth helps in designing equipment used in communication/essential for communication. b. In digital communication, digital signals are used which have two discrete current or voltage values in a signal. Analog signals are used which have continuous current or voltage values in a signal. Alternatively, if a student draws the diagram of the digital signals and analog signals give these(½+½) mark.  (a)  (b) c. A transducer converts one from of energy into another. A repeater enhances the range of a communication system.	½ ½ + ½ ½ ½	3
21.	a) Explanation of magnetic field lines being confined ½ b) Explanation of torque on a magnet due to itself ½ +½ c) Obtaining expression 1 ½ a) If field lines were extremely confined between two ends of a straight solenoid, the flux through the cross section at each end would be non zero. But the flux of field B through any closed surface must always be zero, For a toroid tyhis difficulty is absent. b)No, There is no force on torque on an element due to the field produced by that element itself.	½ ½ ½ ½

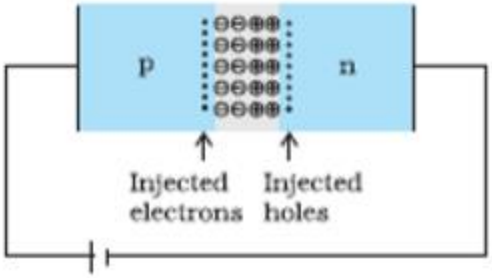
1
1</td>
<td>3</td>
</tr>
</table>

a.



½

During the formation of p - n junction diode: due to the concentration gradient across p and n sides of a diode, holes diffuse from p side to n side and electrons diffuse from n side to p side giving rise to development of immobile positive charges on the n side and the negative charges on the p side across the junction. Thus a potential barrier is formed at the junction.

Alternatively: if a student explains with depletion region, award this 1 mark.
